VISOR SYNDICATE

A key to the trust layer of Robinhood Chain

Living document. Figures marked draft may change before launch.

§ 0

ABSTRACT

Visor Syndicate is a collection of 10,000 machine operatives on Robinhood Chain: 9,990 generative operatives and a council of 10 hand-made 1 of 1s. Each operative is a key.

Today the key opens Visor Edge, the Syndicate's Polymarket bot, live in beta for holders. Next, it opens the Visor Stack: a chain-native safety layer (Sentinel), a trust-first NFT terminal (Lens), a peer-to-peer market for NFTs and stock tokens (Bourse) and an open, bot-resistant launchpad (Forge).

Our thesis is simple. Robinhood Chain has real volume and a real scam problem. Marketplaces compete on fees; nobody competes on trust. We build the trust

layer first, and every product on top of it earns revenue that flows back to holders. There is no fungible token.

§ 1

MARKET AND PROBLEM

Robinhood Chain did $21.5M of NFT volume in September 2026, second only to Ethereum, while token DEX volume runs about $7.75B a week. At least seven marketplaces fight over the chain's NFT trades, and fees have already reached 0% on one of them.

The chain is permissionless by design, and Robinhood has said plainly that tokens on it are not sold or vetted by Robinhood. The result is predictable: one coordinated group ran 53 token launches and pulled about $18.4M in two months; honeypot tokens appeared within the first two weeks of mainnet; and a hijacked executive account was used to promote a fake token.

#	PROBLEM	EVIDENCE
P1	Fake collections, drainers and malicious contracts cost users money	Scam coverage across crypto press; Robinhood's own support pages warn about counterfeits and fake marketplaces.
P2	Token-bound NFTs are valued only by floor price	Nobody shows the stocks and tokens inside them, or what they've paid out.
P3	Listings are split across 7+ venues	Finding the best price means checking each one.
P4	New users need ETH before their first action	The chain's free-gas subsidy ended on 29 Sep 2026.
P5	NFTs holding Stock Tokens trade globally with no eligibility warning	Stock Tokens are barred to US persons.
P6	Token launches are where the biggest losses happen	Token DEX volume runs ~1,500x NFT volume; one group ran 53 launches and pulled ~$18.4M in two months.

Defences today are generic security vendors, compliance partners aimed at institutions, and individual apps blocking tokens one at a time. Nobody is the chain's shared, specialist safety layer. That is the gap.

§ 2

THE SYNDICATE: THE NFT AS A KEY

An operative is access, not a subscription. Products check the wallet for an operative; hold one and you're in, sell or transfer it and the access moves with it. No lists, no renewals.

The mint opens on Fri 20 Nov 2026 · 7:00 AM ET on a partner launch platform. The official link is published only on @visorsyndicate. Operatives are masked at mint and revealed together, with the order sealed before the mint so nobody, including the team, picks who gets what.

The ten council 1 of 1s are hidden among the 10,000. Council holders get priority signals, higher limits and a vote on what the Syndicate builds next.

§ 3

VISOR EDGE (LIVE, BETA)

The Syndicate's Polymarket bot. Live in beta, holders only. Prediction markets move on news faster than people can read it. Most traders act late, size badly and chase feelings at 3am.

- Scan: Watches Polymarket order books and odds around the clock.
- Flag: Surfaces prices it thinks are wrong, with the reasoning.
- Execute: Places positions for you, under limits you set.

Edge runs at pmkt.hollowscan.com. Holders only: without an operative, the bot won't let you in yet.

> Not a promise of returns. The bot can lose money, and Polymarket isn't available everywhere.

§ 4

VISOR SENTINEL: THE SAFETY LAYER

The safety layer for Robinhood Chain. Every token, NFT and contract, scored before you sign.

Scams are the loudest complaint about Robinhood Chain. The chain is permissionless and its tokens aren't vetted by Robinhood. Defences today are generic vendors, institutional compliance tools and apps blocking tokens one at a time. Nobody is the chain's shared, specialist safety layer.

- Score: Reads every new token, collection and contract: owner powers, honeypot sell taxes, upgradeable proxies, deployer history, fake Stock Tokens.
- Warn: Explains in plain English what you're about to give away, before the wallet pops up.
- Serve: The Sentinel API sells the same risk data to wallets, DEXs, bridges, launchpads and AI agents.

Two customers, one dataset. Consumers bring reach: anyone holding an operative gets alerts and pre-sign warnings. Apps bring revenue: wallets, DEXs, bridges, launchpads and AI agents pay for the Sentinel API. Robinhood markets the chain for AI agents; agents trade without human judgment and need machine-readable safety checks.

Fake versions of official Stock Tokens are an obvious next attack. Sentinel checks every swap target against the official token contracts list before a user or agent signs.

> Not an investigator that recovers stolen funds, not an insurer, not a guarantee.

§ 5

VISOR LENS: THE TRUST-FIRST NFT TERMINAL

The trust-first NFT terminal: see what you're really buying, then buy it at the best price.

Collectors can't easily tell real from fake, safe from malicious, or cheap from expensive. Listings are split across 7+ venues, and token-bound NFTs that hold stocks are valued by floor price alone.

- Verify: Genuine vs copycat collection, contract safety from Sentinel.
- X-ray: For token-bound NFTs (ERC-6551): the stocks and tokens inside, payout history, floor vs inside value.
- Route: Finds the cheapest genuine listing across every marketplace and buys it for you, with gasless onboarding.

Token-bound NFTs (ERC-6551) hold their own wallets, and on this chain those wallets hold stocks. They are valued today by floor price alone. Lens shows the inside value, the payout history and the spread between them.
Free gas ended on 29 September 2026, so gasless onboarding is now a real advantage instead of the default. Lens sponsors a newcomer's first actions.

> Not a new marketplace with its own listings at launch. Lens aggregates; Bourse comes later.

§ 6

VISOR BOURSE: PEER-TO-PEER MARKETS

Peer-to-peer trading for NFTs and stock tokens on Robinhood Chain.
Swapping an NFT for a stock token, or a bundle for a bundle, means trusting a stranger or a middleman. OTC deals are where drainers live.

- Offer: Put up NFTs or stock tokens and name what you want back.
- Check: Sentinel screens both sides; stock-token eligibility rules are shown up front.
- Settle: An escrow contract swaps both sides in one transaction, or nothing moves.

> Stock Tokens are barred to US persons; Bourse enforces the issuer's rules, it doesn't route around them.

§ 7

VISOR FORGE: THE OPEN LAUNCHPAD

An open launchpad for tokens and NFTs, with bots and copycats kept out.
On a permissionless chain anyone can launch anything, including 53 coordinated rugs. Creators can't prove they're real, and bots eat fair mints.

- Verify: Creators and contracts pass Sentinel before the page goes live.
- Launch: Fair-mint mechanics with allowlists, per-wallet caps and bot filtering.
- Reach: Listed in Lens and tradeable on Bourse from block one.

Forge closes the loop: launches are verified by Sentinel, discovered in Lens and traded on Bourse from block one.

§ 8

ARCHITECTURE

Sentinel is the base. It indexes every new contract on Robinhood Chain, scores it, and serves those scores to our own products and to third parties through one API.

Lens, Bourse and Forge sit on top and call Sentinel at the moment a user is about to act: buying, swapping, listing or launching. Edge runs alongside, off-chain, against Polymarket.

The operative NFT is the access layer for all of them. Access checks are reads of on-chain ownership; no personal data is required to prove membership.

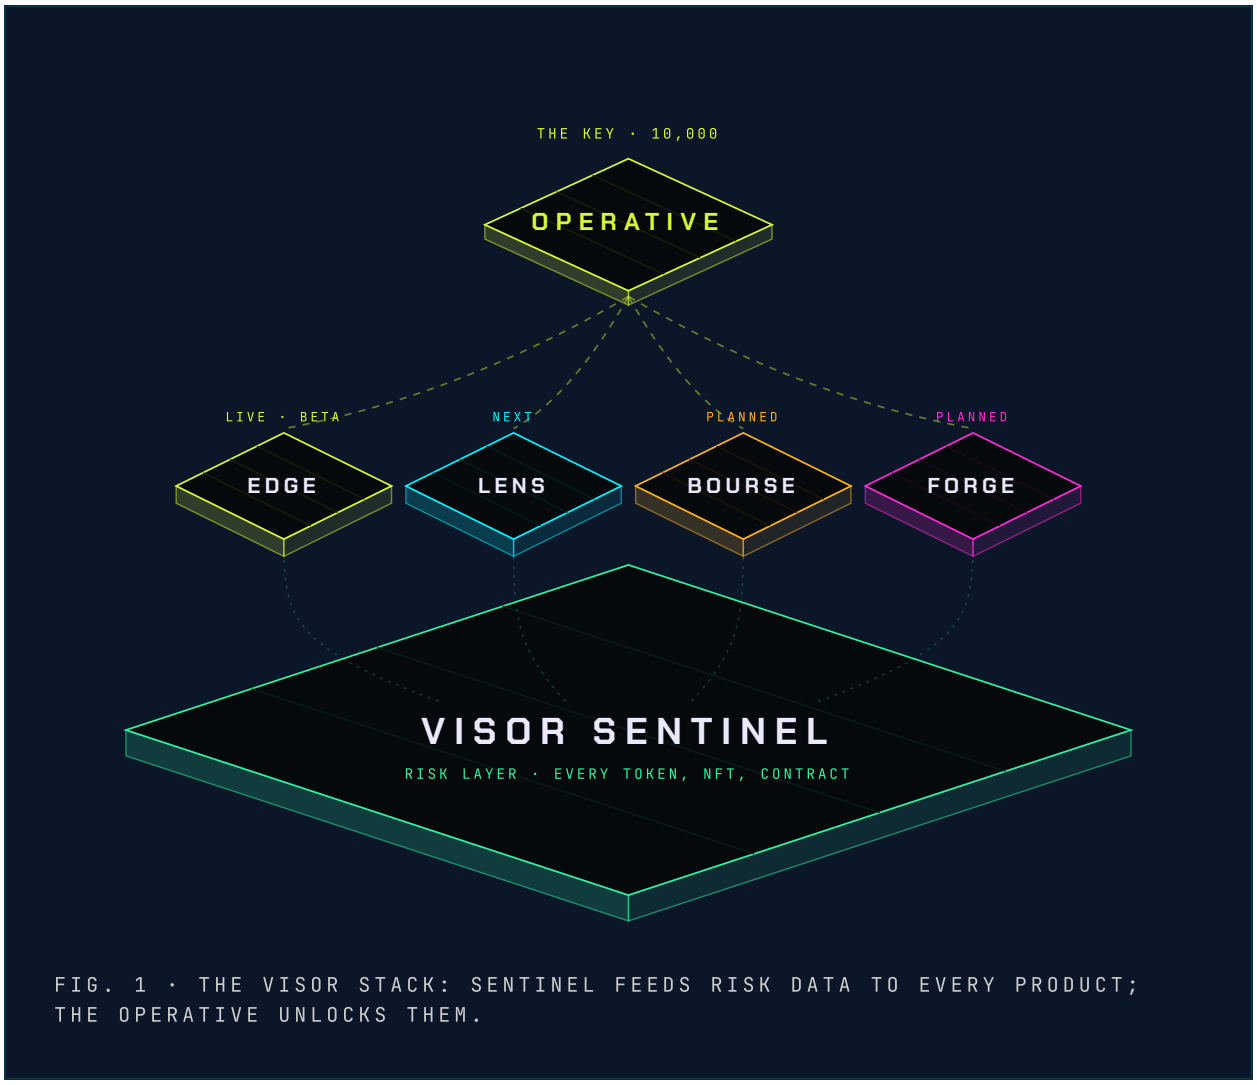

FIG. 1 · THE VISOR STACK: SENTINEL FEEDS RISK DATA TO EVERY PRODUCT; THE OPERATIVE UNLOCKS THEM.

§ 9

ECONOMICS

Supply: 10,000 operatives (9,990 operatives, 10 council 1 of 1s). Creator royalty: 5% where marketplaces honour it (draft).

MINT ALLOCATION (DRAFT)	TOKENS
Guaranteed (GTD)	3,000
First come (FCFS)	3,500
Public	3,300
Team & partners	200

USE OF MINT PROCEEDS (DRAFT)	SHARE
Build the Stack	40%
Treasury	20%
Edge infrastructure	15%
Security & audits	10%
Growth & community	15%

Revenue comes from Edge, the Sentinel API, Lens and Bourse fees, Forge launch fees and royalties. A share of each source is routed to holder rewards; the rest funds building, the treasury and security. The full split lives on the Tokenomics page.

There is no fungible token. Holder rewards come from real revenue, not emissions. Anyone selling a 'Visor token' is running a scam.

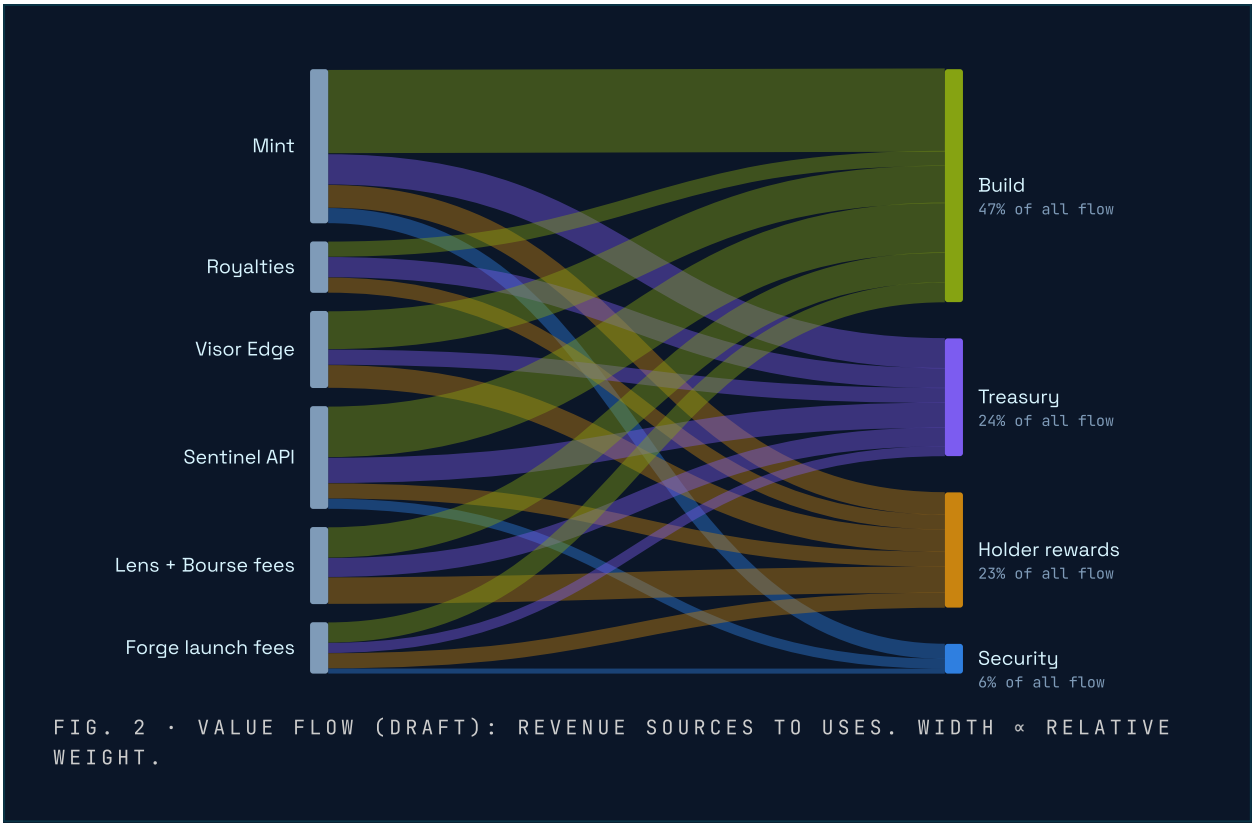

FIG. 2 · VALUE FLOW (DRAFT): REVENUE SOURCES TO USES. WIDTH ∝ RELATIVE WEIGHT.

§ 1 0

ROADMAP

PHASE	WHAT SHIPS	STATUS
Assembly	Collection, council, brand	Complete
Visor Edge	Polymarket bot for holders	Live · beta
Initiation	Mint on a partner platform, Fri 20 Nov 2026 · 7:00 AM ET	Next
Unmasking	Reveal, operative index opens	Next
Visor Sentinel	Risk scores, pre-sign warnings, Sentinel API	Building
Visor Lens	Verification, ERC-6551 x-ray, best-price routing	Next
Bourse + Forge	P2P escrow market; open launchpad	Planned

§ 11

COUNCIL AND GOVERNANCE

The council of ten votes on product priorities and Forge allowlists. Operatives are heard through holder channels and periodic polls. The team keeps operational control of contracts and keys during the build-out, and intends to put anything that moves treasury funds behind a multisig.

§ 12

RISKS AND DISCLAIMERS

- Not financial advice. Prediction markets carry risk and Edge can lose money; past results never guarantee future ones.
- Polymarket is not available in every jurisdiction. Stock Tokens are barred to US persons. You are responsible for your local rules.
- Sentinel is a risk signal, not a guarantee, an insurer or a recovery service.
- Products marked building, next or planned are not live and may change, slip or not ship.
- Operatives are digital collectibles with utility, not securities, and carry no promise of profit. Holder rewards are discretionary.
- Smart contracts can have bugs. Audits and a bug bounty reduce that risk; they do not remove it.

Only trust links on this site and @visorsyndicate. The team will never DM you first or ask for a seed phrase.
